Inquiries	Bohemian1@vansterling.com

## Objectives and Strategy

The strategy Bohemian I generates signals that encompass the entire market. Since the S&P 500 is the largest and most stable index in this area, we focus our attention on this index as a proxy for the entire stock market. We do not trade individual stocks or commodities.

The strategy Bohemian I captures the sentiment of market participants in the equity markets and seeks to generate benefits for investors from each phase of market sentiment. The system is discretionary and uses sentiment indicators and analysis of statistical anomalies to decide independently on the direction of the market in the immediate future - the next trading day.

A daily signal will be provided, long or short, which is valid for the entire trading day, so that only once a day, at the opening bell of the cash market, an incoming position is identified which is held until the closing bell.

Investors must be prepared to accept (even substantial) losses.

## Warning

WHILST USING THEIR BEST ENDEAVOURS TO ATTAIN THESE INVESTMENT OBJECTIVES, THE DIRECTORS AND THE INVESTMENT MANAGER CANNOT GUARANTEE THE EXTENT TO WHICH THESE OBJECTIVES WILL BE ACHIEVED.

**This strategy is maybe not suitable for investors who want to withdraw their invested capital from the strategy within a period of less than 3 years.**

Past performance is not a guide to future performance. Past performance is net of fees incl. VAT. This portfolio started trading in September 2022.

## Risk Management

Each position is continuously monitored. The strategy is continuously adjusted to changing market conditions, while the key risk parameters remain unchanged.

The positions are built up and taken down daily. This means that no positions are taken overnight.

A daily calculated stop loss ensures that false signals do not end in major losses. During the day, the position is not changed in case of a negative trend.

## Good to know

Despite our recommendation to stay with one strategy for at least 3 years, you can access your capital as well as initiate withdrawals whenever you want or need to.

## Risk and Return Profile

← typical lower returns and lower risks      typical higher returns and higher risks →

This risk indicator is based on historical data. A clear prediction for future developments is therefore not possible. The classification of the Managed Account may change in future. Even a Managed Account that is classified in Category 1 cannot be considered as an investment without risks.

The Bohemian I strategy is classified in category 6. The preservation of assets is important to the investor. The investor is prepared to take limited risks and tolerates small to moderate fluctuations and losses.

## Special Risks in trading commodities (and the instrument used. E.g. futures, options, ETF, stocks, etc.)

### 1) Entrepreneurial development

The shareholder does not act as a creditor vis-à-vis the company, but rather as a co-owner of the stock corporation with his shares forming part of the equity capital and thus directly participating in the economic development of the company. The investor is a de facto entrepreneur who can be confronted with both opportunities and risks in the form of price gains or losses.

losses. The shareholder's risk is that the economic situation of the stock corporation may develop differently than originally assumed. Corporate developments are difficult to predict. As a so-called worst case scenario, insolvency proceedings mean the total loss of the capital invested, the share becomes worthless. In the event of insolvency of a stock corporation, the shareholder is not entitled to liquidation proceeds until all creditors' claims have been satisfied.

### 2) Risk of price fluctuation

The two different risk factors, general market risk and company-specific risk, can influence the price of the acquired share.

The stock market is influenced by the economic environment such as the uncertainty of economic growth, inflation, interest rates, foreign exchange rates and economic data. These movements are referred to as market risk, which affects the price of the shares impact. Some companies are more exposed to market risk than others. The company-specific risk is that human error in the management of the companies will cause them to react incorrectly or completely wrongly to changing currents in the market. In the long term, therefore, price changes are dependent on the earnings situation of the respective company. In the short to medium term, however, rising and falling share prices alternate and cannot be predicted. These fluctuations are described as volatility. They can be measured for the past: The higher the price fluctuations the higher is also the volatility.

### 3) Foreign exchange risks

In the case of shares not quoted in euros, investors are exposed to exchange rate risk. A share quoted in U.S. dollars therefore involves not only market and price risks but also the exchange rate risk of the U.S. dollar itself. If the exchange rate of the U.S. dollar is weaker when the share is sold than when it was purchased, these price reductions also affect the share.

### 4) Specific market risk

In addition to general market risk, specific market risks also influence performance. With a commodity investment, you decide to invest in a specific market. If changes occur due to special, individual changes affecting this market, such a new development will affect these shares. Special or individual market risks can be: negative development/news at a significant market participant, change of management, change of special laws or general conditions.
